

## Brief Description

---

1. Remove attribute "AccountID" from table Doctor and Patient.

There is no need to add the AccountID into those two tables to maintain the relationship. Using DoctorID/PatientID to be the foreign key of table Account can do the job.

2. Delete DoctorScheduleBooking since it doesn't have much details.

3. Change the relationship between the DoctorSchedule Entity and the Booking Entity.

The Booking Entity is related to the DoctorSchedule Entity using the foreign key ScheduleID. A DoctorSchedule may have zero or one booking. A booking must be related to a specific doctor's schedule.
